

# A review of R neural network packages (with NNbenchmark): accuracy and ease of use

by Salsabila Mahdi, Akshaj Verma, Christophe Dutang, Patrice Kiener, John C. Nash

## Abstract

For the last 30 years, neural networks have evolved from an academic topic to a common tool in scientific computing. Following this trend, CRAN has chosen to host many packages that claim to provide neural network modeling. Our count in May 2020 is roughly 70 packages. How accurate and reliable are these packages and their documentation? Are there packages that perform better in terms of accuracy? Are some better suited to beginners while others require expert knowledge? Do these packages provide the features found in some dedicated proprietary software?

This paper is, to our knowledge, the first attempt to test this rather large number of packages against a few datasets with different levels of complexity, and to benchmark and rank them with certain metrics. We have restricted our evaluation to regression algorithms applied on the one-hidden layer perceptron and ignored those for classification or other specialized purposes. This left us with 49 package::algorithm pairs in 2019 and 60 package::algorithm pairs in 2020. The criteria used in our benchmark were: (i) the accuracy, i.e. the ability to find the global minima on 13 datasets, measured by the Root Mean Square Error (RMSE) in a limited number of iterations; (ii) the speed of the training algorithm; (iii) the availability of helpful utilities; (iv) and the quality of the documentation.

All pairs packages::algorithms were given a score for each criterion and ranked in a global table. Overall, 15 packages::algorithms are considered accurate and reliable and can be recommended for daily usage. 45 algorithms should be avoided as they are either less accurate, slow, difficult to handle, or have poor or no documentation.

Our codes, templates, and the NNbenchmark package used to test each package::algorithm pair are publicly available at the address <https://github.com/pkR-pkR/NNbenchmark>. These can be used by the package authors and others to verify the metrics and eventually improve their own package or code. Finally, we provide some hints and features to guide the development of an idealized neural network package for R.

## Introduction

(PK) For the last 30 years, neural networks have evolved from an academic topic to a common tool in scientific computing. As a convenience in the general conversation, the same term is used in a generic manner (for a shortcut to) for different model structures and applications: multilayer perceptron for regression, multilayer perceptron for classification, multilayer perceptron for specialized applications (mixture of models, conditional distribution, etc), recurrent neural network for autoregressive time series (NARMAX models), convolutional neural networks for dimension reduction and pattern recognition, deep neural networks for image or voice recognition.

Most of the above types of neural networks can be found in R packages hosted on CRAN but without any warranty about the quality or the accuracy of the calculation, since CRAN has no tools to check them. Package users have to believe package authors who are assumed to have selected the best algorithms and tuned them with the appropriate hyperparameters. This is rather problematic with neural networks as many poor algorithms have been mentioned in the literature, and are probably implemented in a few packages.

The goal of this paper is to verify the accuracy and the ease of use (including the quality of the documentation) of the packages hosted on CRAN that supply the most common neural network structure + algorithm, i.e. the multilayer perceptron for regression purpose.

(SB) The R Project for Statistical Computing ([www.r-project.org](http://www.r-project.org)), as any opensource platform, relies on its contributors to keep it up to date. Neural networks, based on the brain's own connections system, are a class of models in the growing field of machine learning for which R has a number of tools. Previously, neural networks could be considered more theory than practice, partly because the algorithms used are computationally demanding.

A neural network algorithm requires complicated calculations to improve the model control parameters. As with other optimization problems, the gradient of the chosen cost function that indicates the lack of suitability of the model is sought. This lets us improve the model by changing the parameters in the negative gradient direction. Parameters for the model are generally obtained using part of the available data (a training set) and tested on the remaining data. Modern software allows much of this work, including approximation of the gradient, to be carried out without a large effort by the user.

This process can generally be made more efficient if we can also approximate second derivatives of the cost function, allowing us to use its curvature via the Hessian matrix. There are a large number of approaches, of which quasi-Newton algorithms are perhaps the most common and useful. Within this group, methods based on the Broyden-Fletcher-Goldfarb-Shanno (BFGS) algorithm for updating the Hessian approximation (or its inverse) provide several well-known examples. In conducting this study, we believed that these second-order algorithms would perform better than first-order methods.

Regardless of our belief, we wished to be able to conduct a thorough examination of these training algorithms in R. There are many packages, but barely any information to allow comparison. Our work, reported here, aims to provide a framework for benchmarking neural network packages. We restrict our examination to packages for R, and in this report focus on those that provide neural networks of the perceptron type, that is, one input layer, one normalized layer, one hidden layer with a nonlinear activation function that is usually  $\tanh()$ , and one output layer.

## Methodology

??JN: \*\*\*\*\*

In working on material below, I think we need to provide some explanation of goals - What does "convergence" mean in our context? - What do we mean by RMSE, other measures? Should define here for later use. - What do we mean by "performance"? Other goals?

---

Our research process was divided into 3 phases.

### Phase 1 - Preparation

#### Datasets => NEED TO BE FINISHED??

All the datasets we use cannot generally be modeled using a non-iterative calculation such as Ordinary Least Squares. Varying levels of difficulty in modeling the different data sets are intended to allow us to further classify different algorithms and the packages that implement them. Sonja Surjanovic and Derek Bingham of Simon Fraser University created a useful website from which three of the multivariate datasets were drawn. We note the link, name and difficulty level of the three datasets:

- <http://www.sfu.ca/~ssurjano/fried.html> (Friedman - average)
  - <http://www.sfu.ca/~ssurjano/dettep10curv.html> (Dette - medium)
  - <http://www.sfu.ca/~ssurjano/ishigami.html> (Ishigami - high)
- The other multivariate dataset, Ref153, was taken from ...

Three of the univariate datasets we used were taken from a website of the US National Institute for Standards and Technology (NIST): [https://www.itl.nist.gov/div898/strd/nls/nls\\_main.shtml](https://www.itl.nist.gov/div898/strd/nls/nls_main.shtml). (Gauss1 - low; Gauss2 - low; Gauss3 - average)

Univariate datasets Dmod1, Dmod2 are from ...

Dreyfus1 is a pure neural network which has no error. This can make it difficult for algorithms that assume an error exists. Dreyfus2 is Dreyfus1 with errors. NeuroOne from ...  
Wood ...

## Packages

Using **RWsearch** (Kiener, 2020) we sought all were able to automate the process. All packages that have “neural network” as a keyword in the package title or in the package description were included.

The following is a list of packages we included in this study, with brief descriptions.

1. **AMORE** (Limas et al., 2020),
2. **ANN2** (Lammers, 2020),
3. **appnn** (Família et al., 2015),
4. **autoencoder** (Dubossarsky and Tyshetskiy, 2015),
5. **automl** (Boulangé, 2020),
6. **BNN** (Jia, 2018),
7. **brnn** (Rodriguez and Gianola, 2020),
8. **Buddle** (Kim, 2020),
9. **CaDENCE** (Cannon, 2017a),
10. **cld2** (Ooms, 2018),
11. **cld3** (Ooms, 2020),
12. **condmixt** (Carreau, 2020),
13. **DamiaNN** (Siniakowicz, 2016),
14. **deep** (Mayer, 2019),
15. **deepdive** (Balakrishnan, 2020),
16. **deepnet** (Rong, 2014),
17. **deepNN** (Taylor, 2020),
18. **DNMF** (Jia and Zhang, 2015),
19. **elmNNRcpp** (Mouselimis and Gosso, 2020),
20. **ELMR** (Petrozziello, 2015),
21. **EnsembleBase** (Mahani and Sharabiani, 2016),
22. **evclass** (Denoeux, 2017),
23. **gamlss.add** (Stasinopoulos et al., 2020),
24. **gcForest** (Jing, 2018),
25. **GMDH** (Dag and Yozgatligil, 2016),
26. **GMDH2** (Dag et al., 2019),
27. **GMDHreg** (Tilve, 2020),
28. **gnn** (Hofert and Prasad, 2020),
29. **grnn** (Chasset, 2013a),
30. **h2o** (LeDell et al., 2020),
31. **hybridEnsemble** (Ballings et al., 2015),
32. **isingLenzMC** (Suzen, 2016),
33. **keras** (Allaire and Chollet, 2020),
34. **kerasR** (Arnold, 2017),
35. **leabRa** (Titz, 2017),
36. **learNN** (Quast, 2015),
37. **LilRhino** (Barton, 2019),
38. **minpack.lm** (Elzhov et al., 2016),
39. **MachineShop** (Smith, 2020),

40. **monmlp** (Cannon, 2017b),
41. **neural** (Nagy, 2014),
42. **neuralnet** (Fritsch et al., 2019),
43. **NeuralNetTools** (Beck, 2018),
44. **NeuralSens** (Portela González et al., 2020),
45. **NlinTS** (Hmamouche, 2020),
46. **nlsr** (Nash and Murdoch, 2019),
47. **nnet** (Ripley, 2020),
48. **nnetpredint** (Ding, 2015),
49. **nnfor** (Kourentzes, 2019),
50. **nntrf** (Aler and Valls, 2020),
51. **nnli2bRcpp** (Nikolaidis, 2020),
52. **onnx** (Tang and ONNX Authors, 2018),
53. **OptimClassifier** (Perez-Martin et al., 2020),
54. **OSTSC** (Dixon et al., 2017),
55. **pnn** (Chasset, 2013b),
56. **polyreg** (Matloff et al., 2020),
57. **predictoR** (with contributions from Diego Jimenez A. and D., 2020),
58. **qrnn** (Cannon, 2019),
59. **QuantumOps** (Resch, 2020),
60. **quarrint** (Barthelemy et al., 2016),
61. **radiant.model** (Nijs, 2020),
62. **rasclass** (Wiesmann and Quinn, 2016),
63. **rcane** (Suresh et al., 2018),
64. **regressoR** (Rodriguez R., 2019),
65. **rminer** (Cortez, 2020),
66. **rnn** (Quast and Fichou, 2020),
67. **RSNNS** (Bergmeir, 2019),
68. **ruta** (Charte et al., 2019),
69. **simpleNeural** (Dernoncourt, 2020),
70. **snnR** (Wang et al., 2017),
71. **softmaxreg** (Ding, 2016),
72. **Sojourn.Data** (Hibbing and Lyden, 2019),
73. **spnn** (Ebrahimi, 2020),
74. **TeachNet** (Steinbuss, 2018),
75. **tensorflow** (Allaire and Tang, 2020),
76. **tfestimators** (Allaire et al., 2018),
77. **trackdem** (Bruijning et al., 2020),
78. **TrafficBDE** (Chatzopoulou et al., 2018),
79. **tsensembler** (Cerqueira et al., 2017),
80. **validann** (Humphrey, 2017),
81. **zFactor** (Reyes, 2019).

In contrast, we consider the following packages to be ill-suited to our investigations, and include a brief description of each with a reason why we have excluded it.

?? packages here.

## Phase 2 - Review of packages and development of a benchmarking template

From documentation and example code, we learned that not all packages selected by the automated search fit the scope of our research. Some have no function to generate neural networks. They are simply meta-packages. Others were not regression neural networks of the perceptron type or were only intended for very specific purposes.

### Template => TO REVISE AFTER 2020 CODE

As we inspected the packages, we developed a template for benchmarking. The structure

of this template (for each package) is as follows:

- (1) Set up the test environment - loading of packages, setting working directory and options;
- (2) Summary of datasets;
- (3) Loop over datasets: (a) setting parameters for a specific dataset (b) selecting benchmark options (c) training a neural network with a tuned functions for each package (d) calculation of RMSE and MAE (??definition, reference) (e) plot each training over one initial graph, then plot the best result (f) add results to the appropriate existing record (\*.csv file) and (g) clear the environment for next loop; and
- (4) Clearing up the environment for the next package. (5) It is optional to print warnings.

To simplify this process, we developed tools in the NNbenchmark package, of which the first version was created as part of the 2019 GSoC activity and later refined in the 2020 initiative. The package repository is <https://github.com/pkR-pkR/NNbenchmark>, with package templates in <https://github.com/pkR-pkR/NNbenchmarkTemplates>.

### Phase 3 - Collection of and analysis of results

#### Results collection

Looping over the datasets using each package template, we collected results in the relevant package directories in the templates repository.

#### Analysis

To rank the how well a package converged and its speed, we developed the following method:

1. The results datasets are loaded into the R environment as one large list. The dataset names, package:algorithm names and all 10 run numbers, durations, and RMSE are extracted from that list
2. For the duration score (DUR), the duration is averaged by dataset. 3 criteria for the RMSE score by dataset are calculated:
  - a. The minimum value of RMSE for each package:algorithm as a measure of their best performance
  - b. The median value of RMSE for each package:algorithm as a measure of their average performance, without the influence of outliers
  - c. The spread of the RMSE values for each package which is measured by the difference between the median and the minimum RMSE (d51)
3. Then, the ranks are calculated for every dataset and the results are merged into one wide dataframe.
  - a. The duration rank only depends on the duration.
  - b. For minimum RMSE values, ties are decided by duration mean, then the RMSE median
  - c. For median RMSE values, ties are decided by the RMSE minimum, then the duration mean
  - d. The d51 rank only depends on itself
4. A global score for all datasets is found by a sum of the ranks (of duration, minimum RMSE, median RMSE, d51 RMSE) of each package:algorithm for each dataset
5. The final table is the result of ranking by the global minimum RMSE scores for each package:algorithm
6. In addition to the previous metrics, two other convergence metrics have been considered: the Mean Absolute Error (MAE) and the Worst Absolute Error (WAE), see Appendix. The ranking on those two metrics may help distinguish packages with close RMSE values. However, we do not choose the MAE for overall ranking as there

is no consensus in the literature, see e.g. (Willmott and Matsuura, 2005; Chai and Draxler, 2014).

To rank how easy or not a package was to use (TO BE DISCUSSED FURTHER): -  
Functionality (util): scaling, input, output, trace - Documentation (docs): examples, structure/functions, vignettes

## Results

**Tables** (NOTE: FINAL MEASURE FOR CONVERGENCE - RMSE RANKS? OR A COMBINATION OF OTHER MEASURES? As in Christophe's recent email: L1 MAE(), L2 RMSE(), Linfinity (WAE)) -> see Appendix

(ALSO: THE FOLLOWING IS SIMPLY ALPHABETIC LIST FOR ALL TESTED, I WILL DIVIDE THE TABLE INTO 4: 2nd ORDER always recommended, 1st ORDER recommended, 1st ORDER not recommended, untested packages)

## Discussion and Recommendations

A. Recommended: 2nd order algorithms Out of all the algorithms, these second algorithms generally performed better in terms of convergence despite being set to a much lower number of iterations, 200, than the first-order algorithms. Moreover, they performed better in terms of speed. The best in this class were. [minpack.lm](#) and. [nlslr](#), tied at rank number 1. The Levenberg-Marquardt (LM) algorithm used is fast and converges well. `stats::nlm()` is used. However, these packages require a handwritten formula that may not be ideal for certain situations. A more popular package for neural networks is `nnet`. This might be because it is part of base R. It implements the BFGS algorithm with `stats::optim()`.

Ranked directly after are some packages that depend on `nnet` or use the same functions. They differ in how well they decide initial parameters. `rminer` (rank 4), `MachineShop` (rank 5), and `radiant.model` (rank 7) use `nnet`. Note, `radiant.model` has its iterations set to 10000, which originally made it slower yet converge better. We used a modified version of the package. At rank 6 is `validann`'s BFGS algorithm using `stats::optim()`. Its use of `optim`'s L-BFGS-B ranked at number 9 with `CaDENCE`'s use of `optim`'s BFGS.. [monmlp](#), from the same author as `CaDENCE` (Alex Cannon), uses the package. [optimx](#)'s BFGS ([Nash and Varadhan, 2020](#)).

Alex Cannon also implemented a quantile regression neural network in `qrnn` with `stats::nlm()`. It requires more iterations and is not as fast compared to the other second-order algorithms. However, it is a valuable implementation of quantile regression. Last but not least is [brnn](#)'s Gauss Newton algorithm which ranks at number 8. `brnn` is easy to use but does not converge as well due to a hidden constraint: a missing first parameter. Furthermore, `brnn`'s algorithm minimizes the sum of squared errors and a penalty on parameters instead of just the sum of squared errors. This may prevent parameters to get highly correlated, especially with an almost degenerated Jacobian matrix.

B. Recommended: 1st order algorithms `validann` `optim` CG -slow RSNNS SCG h2o back-propagation RSNNS Rprop ANN2 adam CaDENCE Rprop -SLOW deepnet BP AMORE ADAPTgdwm AMORE ADAPTgd ANN2 sgd auttml trainwgrad ANN2 rmsprop RSNNS BackpropChunk RSNNS BackWeightDecay RSNNS Std\_Backpropagation RSNNS Backprop-Momentum auttml trainwpso `validann` `optim` NelderMead `snnR` Semi Smooth Newton RSNNS BackpropBatch `validann` `optim` SANN `monmlp` `optimx` Nelder Mead

C. Not recommended: 1st order algorithms <- DISCUSS CUTOFF By package `ELMR`, `elmNNRcpp` - fast ELM algorithms. Unfortunately, can't finetune, does not converge well. `neuralnet`: a large ammount of iterations, slow, erratic failures `tensorflow`: NOT EASY TO USE, subsequently `keras`, `tfestimators`, `ruta` ... user needs to understand the language However, advanced users might be able to highly specify a neural network to their needs (customization?)

By algorithm: `neuralnet` `rprop+` `neuralnet` `rprop-` `neuralnet` `slr` - once ranked well with 100000 iterations AMORE BATCHgd CaDENCE pso psoptim - need to reconfigure? `elmN-NNRcpp` - fast, no iterations RSNNS Quickprop (?) AMORE BATCHgdwm `tensorflow` MomentumOptimizer `tensorflow` AdamOptimizer `ELMR` - fast, no iterations `tensorflow` GradientDescentOptimizer `keras` rmsprop `keras` adagrad `keras` sgd `keras` adadelta `tensorflow` AdagradOptimizer `keras` adam `tensorflow` FtrlOptimizer `neuralnetwork` sag `tensorflow` AdadeltaOptimizer `neuralnet` backprop - note, might not actually reflect standings, somehow from template to template the learning rate disappeared. Will fix this in future runs

D. Untested => TO DO - LIST

## Conclusion => TO DO AFTER 2020 CODE

??JN: Can we start to put in some major findings? i.e., important positive findings, big negatives?

## Future work

As the field of neural networks continue to grow, there will always be more algorithms to validate. For current algorithms in R, our research should be extended to encompass more types of neural networks and their data formats (classifier neural networks, recurrent neural networks, and so on). Different rating schemes and different parameters for package functions can also be tried out.

## Acknowledgements

This work was possible due to the support of the Google Summer of Code initiative for R during years 2019 and 2020. Students Salsabila Mahdi (2019 and 2020) and Akshaj Verma (2019) are grateful to Google for the financial support.

How do we proceed?

## Appendix

Consider a set of observations  $y_i$  and its corresponding predictions  $\hat{y}_i$  for  $i = 1, \dots, n$ . The three metrics used were:

$$MAE = \frac{1}{n} \sum_{i=1}^n |y_i - \hat{y}_i|, RMSE = \frac{1}{n} \sqrt{\sum_{i=1}^n (y_i - \hat{y}_i)^2}, WAE = \frac{1}{n} \max_{i=1, \dots, n} |y_i - \hat{y}_i|.$$

These values represent the absolute, the squared and the maximum norm of residual vectors.
