### 2.2 Graphics for top-5 packages

Figures below provides some insights where a package performs reasonably well with respect to one explanatory variable and where the fit misses the correct behavior of an explanatory variable. It displays the average response per rounded explanatory variable for the predicted, the empirical and the theoretical values. That is, the empirical value and the predicted value for the  $j$ th explanatory variable are respectively computed at x-value  $x$  as

$$\bar{y}_j^{emp}(x) = \frac{1}{n_x} \sum_{i=1}^n y_i 1_{r(x_{i,j})=x}, \quad \bar{y}_j^{pred}(x) = \frac{1}{n_x} \sum_{i=1}^n \hat{y}_i 1_{r(x_{i,j})=x}, \quad n_x = \sum_{i=1}^n 1_{r(x_{i,j})=x},$$

where  $r()$  denotes the round function with two decimal places and  $y_i, \hat{y}_i$  stand respectively for the  $i$ th observed response and the  $i$ th predicted response. For instance, **MachineShop**, **nnet**, **nlshr** do not correctly capture the sinusoidal aspect of explanatory variable  $x_5$  on the expected response, whereas **rminer**, **validann** miss the increasing non-linear trend of explanatory variable  $x_1$  on the expected response.
