2.2 Graphics for top-5 packages

Figures below provides some insights where a package performs reasonably well with respect to one explanatory variable and where the fit misses the correct behavior of an explanatory variable. It displays the average response per rounded explanatory variable for the predicted, the empirical and the theoretical values. That is, the empirical value and the predicted value for the jth explanatory variable are respectively computed at x-value x as

$$\bar{y}_j^{emp}(x) = \frac{1}{n_x} \sum_{i=1}^n y_i 1_{r(x_{i,j})=x}, \ \bar{y}_j^{pred}(x) = \frac{1}{n_x} \sum_{i=1}^n \hat{y}_i 1_{r(x_{i,j})=x}, \ n_x = \sum_{i=1}^n 1_{r(x_{i,j})=x},$$

where r() denotes the round function with two decimal places and y_i , \hat{y}_i stand respectively for the *i*th observed response and the *i*th predicted response. For instance, **MachineShop**, **nnet**, **nlsr** do not correctly capture the sinusoidal aspect of explanatory variable x_5 on the expected response, whereas **rminer**, **validann** miss the increasing non-linear trend of explanatory variable x_1 on the expected response.

Figure 2: Average predicted mean per explanatory variable for MachineShop

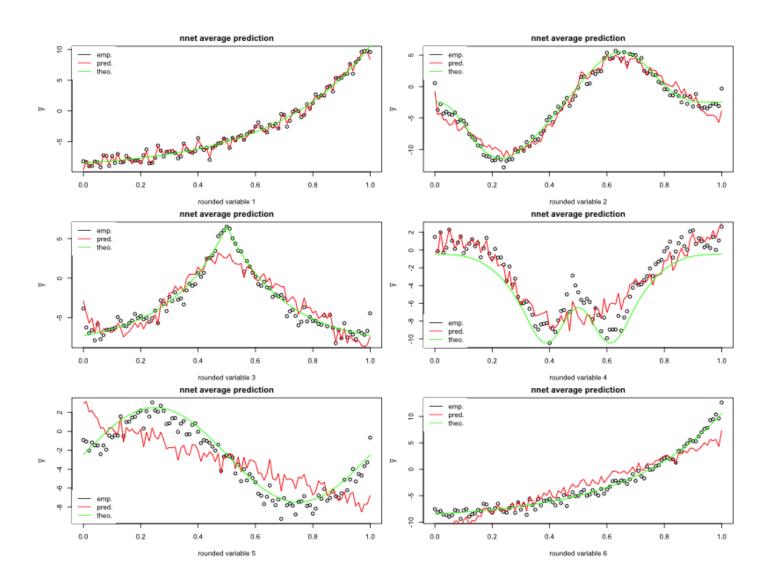

Figure 3: Average predicted mean per explanatory variable for nnet

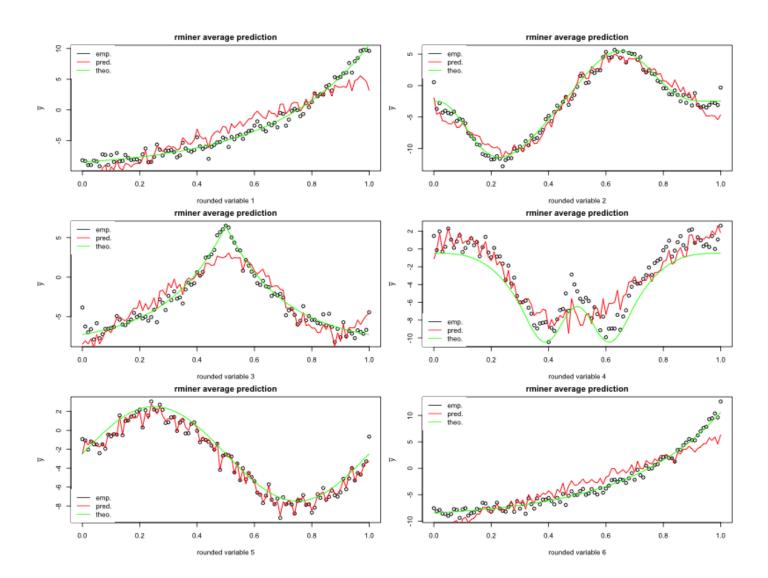

Figure 4: Average predicted mean per explanatory variable for rminer

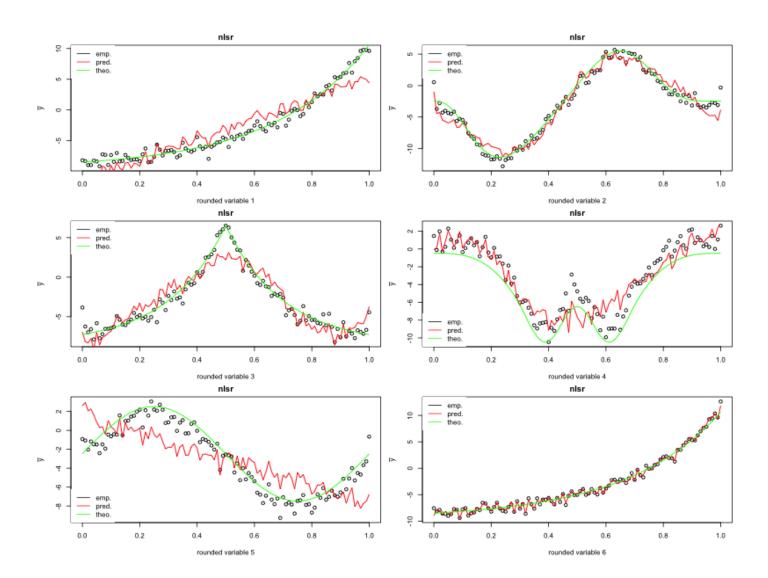

Figure 5: Average predicted mean per explanatory variable for ${\tt nlsr}$

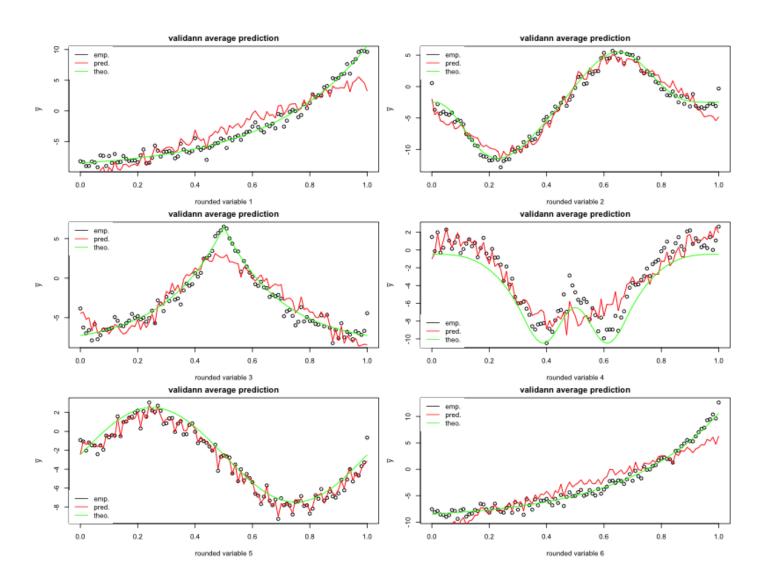

Figure 6: Average predicted mean per explanatory variable for validann
